Fundamental Objects
foSync—The Mobile Virtual Private Network

foSync/Mobile is an easy to use Virtual Private Network (VPN), for connecting your field staff to enterprise servers. **foSync** is a simple, reliable synchronization infrastructure, providing the benefits of an enterprise-wide sync server without the high costs.

Using **foSync**, your staff will connect to a Windows® server, hosted by our ISP partners. Optionally you can connect to a server hosted within your organization instead.

Once connected, users can send and receive any physical files structure supported by the mobile. **foSync** also supports **foAudits** data syncs, as well as accessing **foReports**.

This means that you can use **foSync** to update your staff's Mobile applications when they are in the field—without running a full remote sync to do so.

A variety of security levels are in place to control access to the backend server, ranging from Windows challenge/response to our own encryption layer.

A company can create their own secured "Tunnel", to pass email, data files or application specific synchronization, across a internal VPN network.

Advantages

The major advantage to all of this is in reduced cost and that **foSync** can be run as a private VPN.

The Mobile Hotsync Server has a per server charge as well as run time user licensing/pricing.

Our solution is Windows 200x-based. SQL Server is used to provide an additional level of User/Role security.
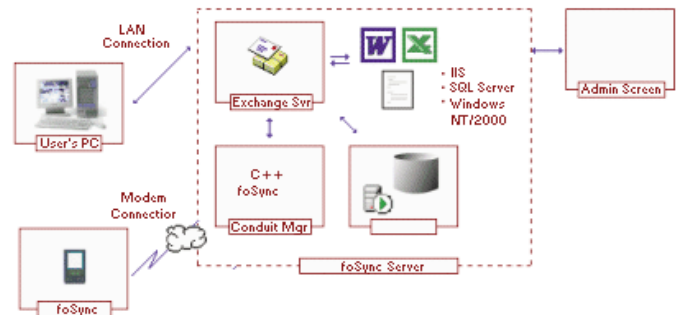

foSync infrastructure

foSync Requirements:
Android 2.3+, iOS 4+, WinMob 6+, Playbook

foSync Server
- Windows 200x+ Server,
- SQL Server

foSync Pricing:
foSync Server $6000
foSync Mobile $25/user registration fee
